# GPS Tracking

Know exactly where your users are as they track their time throughout the day

Problem:

Supervisors need the ability to keep track of remote workers while they are in the field.

Solution:

honeybeeBase has settings that can require users to wait for their device to send their GPS coordinates before using the time clock allowing supervisors to see exactly where they are at the moment of the time punch.

Key Features

• GPS coordinates can be required before a punch is submitted

• Time clock access can be limited to the app while all other functions are available anywhere

• All of a users punches can be viewed together on a map with punch details
